

SpaceX rated Outperform in new coverage by Oppenheimer on post-IPO upside

Jun 11, 2026, 8:44 AM ET | **Space Exploration Technologies Corp. (SPCX) Stock** | By: Rob Williams, SA News Editor

SpaceX ([SPCX](#)) received an Outperform rating from Oppenheimer ahead of its expected stock market debut on Friday, with the brokerage arguing that Elon Musk's company is uniquely positioned to capitalize on the convergence of artificial intelligence, communications infrastructure and space-based computing.

Analyst Timothy Horan assigned a \$190 price target, implying roughly 41% upside from SpaceX's ([SPCX](#)) IPO price of \$135 per share. The initiation comes as investors prepare for one of the most closely watched public listings in recent years.

Oppenheimer described SpaceX ([SPCX](#)) as the only company with a fully integrated technology stack spanning AI models, communications networks, hardware, manufacturing capabilities and engineering talent. Horan argued that this combination could enable the company to address a market opportunity worth as much as \$10 trillion by 2035.

The bullish outlook underscores how some Wall Street analysts increasingly view SpaceX ([SPCX](#)) not merely as a launch and satellite operator, but as a long-term AI infrastructure play. If investors embrace that narrative, the company could command valuation multiples more commonly associated with leading artificial intelligence firms than traditional aerospace businesses. However, the thesis depends on SpaceX executing an ambitious expansion strategy that would require substantial capital investment and technological breakthroughs.

Horan's valuation is based on discounted cash flow estimates and projections that envision SpaceX ([SPCX](#)) generating approximately \$900 billion in annual revenue and \$500 billion in EBITDA by 2035. Achieving those targets would require roughly \$1.6 trillion of cumulative capital expenditures and spectrum-related investments, along with additional external funding.

According to Oppenheimer, access to public capital markets is a critical component of Musk's broader AI ambitions. The analyst said SpaceX ([SPCX](#)) will likely need significant financial resources to build communications and computing capacity and potentially pursue acquisitions in the AI sector.

Horan also suggested a future combination with Tesla remains a possibility, though he expects the companies to remain separate in the near term while operating within a broader ecosystem that supports capital raising and strategic coordination.

The firm cautioned that the investment case carries considerable risks, including regulatory hurdles, technology challenges, execution concerns and the possibility that investor expectations outpace results. Oppenheimer noted that developing thermal-management systems capable of supporting advanced chips in space within the next four years could prove difficult.

Despite those concerns, the analyst believes SpaceX's ([SPCX](#)) existing space-based infrastructure provides a structural advantage over potential competitors.

For the stock's first days of trading, Oppenheimer expects elevated volatility and an initial upward move driven by strong retail demand, limited share availability and the prospect of accelerated inclusion in major stock indexes.

From 3B to 500B\$ EBITDA in 7 years, and more than twice the size of Nvidia.

Makes as much sense as Musk colonizing Mars. *(edited)*
