

SpaceX renting out computing may signal another Colossus data center: Wedbush

Jun 24, 2026, 8:10 AM ET | [Space Exploration Technologies Corp. \(SPCX\) Stock](#), [NVDA Stock](#) | [GOOG](#), [GOOGL](#), [ANTHRO](#) | By: Chris Ciaccia, SA News Editor

SpaceX ([SPCX](#)) has rented out its computing capacity to three companies, including the [deal](#) with Reflection earlier this week. These moves could be a precursor to building another massive Colossus data center, Wedbush Securities said.

“With SpaceX having rented out much of the Colossus capacity (Wccf suggests xAI is left with access to only ~11% of Colossus 1's FLOPs) we would not be surprised if these deals foreshadow another large Colossus data center build-out,” Wedbush analyst Matt Bryson wrote in a note to clients. “In the past, purchases by [Elon] Musk companies have created meaningful blips in component demand even during periods of surplus; now with the component supply chain struggling to meet requirements (even before another xAI build), we wonder how/ if suppliers will be able to support an incremental lift in demand. We'd note that in the past, certain systems vendors (SMCI, Dell, VAST, DDN) have been particular beneficiaries of xAI buildouts.”

SpaceX shares were little changed in premarket trading on Wednesday.

As part of the deal, SpaceX will be renting out capacity to its Nvidia ([NVDA](#)) GB300 GPUs at its Colossus 2 data center to Reflection. SpaceX is set to receive payments from Reflection of \$150M per month for the next three years, though the deal can be terminated by either party with a 90-day notice after three months.

SpaceX recently signed similar but much larger computing capacity agreements with [Google](#) ([GOOG](#))([GOOGL](#)) and [Anthropic](#) ([ANTHRO](#)). These data center leasing deals, along with its planned acquisition of the popular AI-coding platform Cursor, have created new revenue streams for the company following its [historic initial public offering](#).

Is Colossus named after the 1970s movie? Here's the summary:

“Colossus: The Forbin Project (1970) is a pioneering sci-fi thriller directed by Joseph Sargent. Based on the 1966 novel by D.F. Jones, it explores the terrifying consequences of an artificial superintelligence taking control of global nuclear arsenals to force human "peace.”

Oh that Elon. Either he loves irony or he misreads science-fiction classic. I'd say the latter.

Ever since Space X IPOed it seems like plenty of stocks are just dropping. I figured it would be a boost to tech and other defense/ space related stocks.

[@freedomrd1776](#) I thought it'd be neutral; a lot of the capital for defense comes from the Pentagon, and their spending intentions are known. SpaceX isn't going to sit on the capital its raised; the question is what do they get for it.

SpaceX signed a deal with Humain (which is backed by the Saudi Public Investment Fund) last November to build a data center in Saudi Arabia which should be larger than Colossus 2.

[www.humain.com/...](#)

[Under the scope of the agreement, HUMAIN and xAI will jointly develop a network of world-class GPU data centers, anchored by a flagship 500 MW+ facility, which is set to become one of the most advanced AI compute hubs globally. This will be in addition to xAI's existing superclusters and represents the first large-scale compute deployment for xAI outside of the United States.]

[@Just Some Guy](#) Yup. In Memphis, TN, Southaven, MS and Abilene, TX. Do you see a common theme here? All red states which don't believe in Green Energy. 100s of gas turbines emit so much pollution in days that one large city with millions of cars will not emit in one year.

Sad that these states have decided to prioritize a Trillionaire's business more than health of people.

@fmdude not quite that many, I don't think. And as things go, relatively clean. But still, doesn't quite seem right, though it's a little hard to say just why.

The hubriocity aside, the question of pressure upon supply chains, is the right one. With everyone raising capital via equity, debt, beg, borrow, search the sofa, component pricing is poised to go even more bananas than it is.

@MilburnPennybags I wouldn't buy the dip at even 50. But the only question is do more robin hood bag holders emerge for another trade before 90 to 115. (edited)

SpaceX has \$100 billion in cash now. They clearly have short-term plans to use this cash quickly, which probably means buying more Nvidia servers. It seems like they just doubled their revenues with deals announced in the last two weeks, renting server space to Google and others. It seems like there might be a lot more where that came from if they can be price competitive in this space and since they are financing it using over-inflated shares from the IPO, they should get a good return on investment. I could see SpaceX doing over \$100 billion in revenues next year, up from \$25 billion.

The other question is, will this increase Nvidia earnings?

@TheCaminoGuide

Nvidia's so large now I think it's difficult for any one deal to move the needle alone. I posted the following comment earlier. It references the 500MW+ data center xAI and Humain are building in Saudi Arabia. The article mentions that it will use Nvidia GPUs.

[seekingalpha.com/...](#)

A number of articles such as the below Data Center Dynamics article also indicate that this will be the first among many planned data centers in Saudi Arabia that xAI and Humain will build. From what I've seen Musk seems to prefer Nvidia GPUs.

The fact SpaceX rented out it's capacity IS the red flag itself. It's xAI model is dead and screams demand issues!

@CryptoLudolf Elon is pretty good about re-inventing his sales Ptch for the future while never actually achieving much in cash flow. I guess he's thinking SpaceX can be the next AWS between earth bound datacenters and the pie in sky Space based datacenters. This

Collosus2 will face a lot higher component costs and could end up being an albatross if we do see this bubble popped. I agree its kind of obvious Grok has flopped and that is why the capacity is available to sell.

@Pretired "Space based datacenters."

Of course, the thing most people (perhaps Musk included?) don't understand is that physics does not work well for datacenters in space, because there is no medium to get rid of excess heat.

Space is "cold", yes, but it is also a vaccuum, which means you cannot "vent" cool air in or warm air out. The only heat management solution would be astronomically-sized heat sinks for radiative cooling.

@RepairmanJack most users do not need pricey frontier models. Plus they don't want to compromise client data — not to mention absorb uncontrolled token usage. Go to YouTube and search for an interview of the CEO of Cohere. You'll find it eye-opening.

Or it means that xAI is not able to consume existing capacity for their Inference or Agentic Models. We all can interpret in whichever the way we want. It looks like Musk is trying to stay afloat. Renting business is a low margin business. It will be very interesting to see where SPCX price settles once AI hype bottoms.

Yesterday, 11:27 AM ⋮

@fmdude Yes, as the slew of new datacenters continues coming online, computing capacity will become a commoditized good, with a race to the bottom on pricing. If the datacenters are able to rent their excess capacity for any kind of significant margin today, then it won't take long at all before that margin is crushed by competitors.
